No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence Sequence Sequence

GENERAL INFORMATION:
APPLICANT: Novozymes Biotech, Inc.
APPLICANT: Connelly, Mariah
APPLICANT: Connelly, Meriads
APPLICANT: Brody, Howard
TITLE OF INVENTION: Methods For Producing Biological Substances In Enzyme-Deficient
TITLE OF INVENTION: Mutants Of Aspergillus Niger
FILE REPERENCE: 10345,200-US
CURRENT APPLICATION NUMBER: US/10/815,495
CURRENT FILING DATE: 2004-03-31
NUMBER OF SEQ ID NOS: 30

Disclosure; Page 188; 196pp; Korean.

3.2.1.133) having improved transplaces of the comprising many and any analysis. Manufacturing maltogenic amylase comprises the following steps: crystallisation and the three dimensional structure of maltogenic amylase comprises the following steps: (i) obtaining a gene of maltogenic amylase from Thermus sp. IM6501 (KCTC 5027BP) and inserting the gene into plasmid pUC119 to construct recombinant DNA (pThMAI19); (ii) inserting the recombinant DNA to Escherichia coli MC1061, which is cultivated at 37 plus degrees Celsus for 10 hours in Luria Bertani (LB) media and centrifuging the media to obtain a microbial cell; (iii) suspending the microbial cell; (iii) suspending the microbial cell with buffer solution at pH 7.5 and obtaining supernatant; and (1v) passing the supernatant through column chromatography and obtaining purified maltogenic amylase is a dimer comprised of two The present invention describes manufacturing maltogenic amylase (BC

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being prihted, and is derived by analysis of the total score distribution.

The sequence can be mutated by substitution of one or more of its methionine residues for any amino acid other than cysteine. The mutant alpha-amylase exhibits a better activity level and better stability in the presence of oxidising agents than previous mutant alpha amylases, and improved thermostability at moderately low ph. The enzyme can be used as an additive for detergents, dishwashing agents and liquifaction agents. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mutant alpha-amylase from Bacillus species comprising a methionine substitution - with improved stability and activity at low pH, for use in detergents, dishwashing agents and liquefaction agents.
 maltogenic amylase molecules, and a Thermus sp. IM6501 maltogenic amylase
             (ThMA) crystal. The amylase has a structure containing an activated region that consists of amino acid residues of Asp-328, Glu-357, Asp-424, and a pocket with glucose bound that consists of amino acid residues of Pro44, Tyr45, Arg81, Arg83, Pro118, Cys116, Asn131, Glu1332, Val1329, and His1360. The present sequence represents Aspergillus oryzae TAKA protein (TAA), given in comparison with ThMA in the present invention
                                                                                                                                                                                               Gaps

The enzymes have one or more amino acid residues added, deleted or substituted. The variants can also be used for textile desizing prior to scouring, bleaching and dyeing. The variants have improved thermostability, acid/alkaline stability, low temperature optimum; pH optimum; higher hydrolysis velocity and improved tolerance to other composition constituents, e.g. oxidation agents. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents the mature form of taka-amylase from A. oryzae. This sequence was used in a method for the generation of mutant pullulanases for use in the food industry (see also AAR79026-28). The wild type pullulanase enzyme was modified by the method of the invention for enhancing the hydrophobicity of a selected site of the pullulanase. The method comprises replacement of a group in the selected site with a hydrophobic group, replacement of an amino acid with a hydrophobic anion acid, and/or insertion or deletion of a hydrophobic amino acid from the selected site. The method was used to produce neopullulanases Y377F,
                                                                                                                                                                                                                                                                              Modifying a transferase by enhancing hydrophobicity of a selected site increases transfer activity, also new mutant neo-pullulanase(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       alpha-amylase; mature; Bacillus licheniformis; termamyl; fungamyl; Aspergillus oryzae; Bacillus amyloliquefaciens; altered property; eaclium dependency; substrate binding; stability; pH optimum; thermostability; cleavage; oligosaccharide substrate; dishwashing; washing; detergent additive; fabric desizing; starch liquefaction;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oxidation stable alpha amylases can be used for the simultaneous desizing and bleaching or scouring of a fabric comprising starch or starch derivatives. They exhibit a better heat stability, sepecially in the presence of oxidising agents. They are obtained from a parent alpha amylase by replacing one or more methionine residues with any amino acid different from Cys or Met, preferably Leu, Thr, Ala, Gly, Ser, Ile or Asp. The parent alpha amylase is pref. derived from a Bacillus species, although alpha amylases of fungal origin can also be used. This sequence is the wild type (unmodified) alpha amylase of Aspergillus oryzae,
   Alpha amylase; oxidation; desizing; bleaching; scouring; fabric; starch; thermostable; methionine; Bacillus licheniformis; amyloliquefaciens; Bacillus stearothermophilus; Aspergillus converses

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Variants of parent termanyl—and fungamyl—like alpha-amylases (and methods of constructing them) are claimed. Examples of variants are featured above. The variants have altered properties such as calcium dependency, substrate binding and stability. Also one or more proline or cysteine residues in the variant is modified or replaced with a non-proline or non-cystein residue such as alanine. The variants can be used for (dish)washing, as detergent additives or for tablic desizing or starch liquefaction. They can also be used for the production of sweeteners and ethanol from starch. specification describes variants of this fungamy1-like alpha-amylase, which have an alteration in one the amino acid regions 98-110, 150-160, 161-167, 280-288, 448-455, and 468-475. Each alteration is a deletion of substitution of an amino acid or an insertion of an amino acid downstream of a particular position. The variants retain alpha-amylase activity, and have better heat stability and/or stability at acidic ph; relative to wild-type enzyme. The variants can therefore be used at higher temperatures (more efficient conversion or faster reaction, and have reduced need for cooling and reduced risk of contemination). The variants may also be used in conjunction with other enzymes, particularly glucoamylase during dextrinisation. The variants are used to produce syrups, particularly of high mallose content, or alcohol, from starch, as dough improver for baked goods; in brewing, to increase fermentability of the wort; and for liquefaction of starch
                                          variant of Fungamyl-like alpha-amylase, useful for production of tose syrups, includes mutations that improve stability against heat acidic pH.
                                                                                                                                                   present sequence represents a fungamyl-like alpha-amylase.
                                                                                                                                                                                                                                                                                                                                                                                                                                DB 4; Length 498;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Aspergillus niger neutral alpha-amylase A (amyA) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Glucoamylase; glaA; amyA; alpha-amylase A; enzyme.

Producing heterologous biological substance comprises culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance and recovering heterologous biological Bubstance

Example 11; SEQ ID NO 22; 58pp; English

```
ö
The present invention relates to a method of producing heterologous hological substance. The method involves culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance, where mutant strain comprises first nucleotide sequence encoding heterologous biological substance and second nucleotide heterologous biological substance and second nucleotide heterologous biological substance. The present sequence is the Aspergillus niger neutral alpha-amylase A (amyA) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method of producing heterologous biological substance. The method involves culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance, where mutant strain comprises first nucleotide sequence encoding heterologous biological substance and second nucleotide sequence comprising modification of glucosmylase (glash) and recovering heterologous biological substance. The present sequence is the Aspergillus niger neutral alpha-amylase B (amyB) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present invention describes polynucleotides which encode processing enzymes (e.g. alpha-amylase, pullulanase, alpha-glucosidase, glucose isomerase, or glucoamylase) that are optimised for expression in plants. The polynucleotides encode mesophilic, thermophilic or hyperthermophilic processing enzymes, which are activated under suitable conditions to act processing enzymes, which are activated under suitable conditions to act plants and plant parts, e.g. grain, which express one or more of these enzymes and have an altered composition that facilitates plant and grain processing. Also described is a method (M) for converting starch to starch-derived products in a transformed plant part (TPP), by activating the starch processing enzyme contained in it. Transgenic grain is useful or produce food products having improved taste and to produce fermentable substrates for channol and fermented beverages. (M) eliminates the need to mill or physically disrupt the integrity of plant parts prior to recovery of starch-derived products. The present sequence represents alpha-amylase/glucoamylase fusion procein, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   alpha-amylase, useful for producing plant to produce food products having improved taste or fermentable substrates for ethanol.
                                                                                                                                                                                                                                                                                                                                                                           Self-processing plant; plant; processing enzyme; alpha-amylase; grain; pullulanase; alpha-qlucosidase; glucose isomerase; glucoamylase; mesophilic; thermophilic; hyperthermophilic; transgenic plant; starch; maltodextrin; ethanol; fermentation; beverage; enzyme.
                                                                                                                                                                                                                                                                                                    Alpha-amylase/glucoamylase fusion protein sequence SEQ ID NO:45.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Craig J, Kinkema M;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 40; DB 6; Length 1095; 100.0%; Pred. ```

Thermophilic alpha-amylase with activity range of 60-80 degrees C -derived from Thermomyces lanuginosus, useful in the prepn. of foodstuffs and bakery prods. esp. bread.

Claim 3; Page 36-38; 94pp; English.

```
A thermostable alpha-amylase (AAR88212) of Thermomyces lanuginosus CBS 224.63 is expressed in Aspergillus niger hosts using a gene (AAT10562) isolated from a T. lanuginosus gene library. The recombinant enzyme (54-60 kDa) shows optimal activity at 60-70 deg and pH 5.8-6, has a pI of 3.7 and is active at 60-80 deg. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                24-JUN-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -NUT-83
                                                                                                                                                                                                                                                                                                                             03-JUN
 ö
                                                                                                                                                                                                                    The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to eryctokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerides and polymerides are useful in gene therapy, vaccines or populations. The polymerides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, mematopoiesis regulating activity, issue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                      Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                             ö

New variant of Fungamyl-like alpha-amylase, useful for production of maltose syrups, includes mutations that improve stability against heat and acidic pH.

Claim 1; Page 42-45; 49pp; English.

The present sequence represents a fungamyl-like alpha-amylase. The specification describes variants of this fungamyl-like alpha-amylase, which have an alteration in one the amino acid regions 98-110, 150-160, 161-167, 280-288, 484-455, and 468-457. Each alteration is a deletion or substitution of an amino acid or an insertion of an amino acid downstream of a particular position. The variants retain alpha-amylase activity, and have better heat stability and/or stability at a cidic pH, relative to wild-type enzyme. The variants can therefore be used at higher reduced need for cooling and reduced risk of contamination). The variants may also be used in conjunction with other enzymes, particularly glucoamylase during dextrinisation. The variants are used to produce

The present invention relates to a method of producing heterologous halological substance. The method involves culturing mutant of wild-type hapergillus niger strain in medium suitable for producing heterologous biological substance, where mutant strain comprises first nucleotide sequence encoding heterologous biological substance and second nucleotide heterologous biological substance and second nucleotide heterologous biological substance. The present sequence is the Aspergillus niger neutral alpha-amylase B (amyB) protein.

Variant alpha amylase enzymes which have improved washing and/or as detergent additives. The enzymes have one or more amino acid residues added, deleted or substituted. The variants can also be used for textile desizing prior to scouring, blacching and dyeing. The variants have improved thermostability, acid/alkaline stability; low temperature optimum; higher hydrolysis velocity and improved tolerance to other composition constituents, e.g. oxidation agents. (Updated on 25-WAR-2003 to correct PN field.)

 Oxidation stable alpha amylases can be used for the simultaneous desizing and bleaching or scouring of a fabric comprising starch or starch derivatives. They exhibit a better heat stability, especially in the presence of oxidising agents. They are obtained from a parent alpha amylase by replacing one or more methionine residues with any amino acid different from Cys or Met, preferably Leu, Thr, Ala, Gly, Ser, Ile or Asp. The parent alpha amylase is pref. derived from a Bacillus species, although alpha amylases of fungal origin can also be used. This sequence is the wild type (unmodified) alpha amylase of Aspergillus oryzae

į

Borchert

'n

```
The present sequence is the mature Aspergillus oryzae alpha-amylase (A). Variants of parent termamyl- and fungamyl-like alpha-amylases (and methods of constructing them) are claimed. Examples of variants are featured above. The variants have altered properties such as calcium dependency, substrate binding and stability. Also one or more proline or cysteine residues in the variant is modified or replaced with a non-proline or non-cystein residue such as alanine. The variants can be used for (dish) washing, as detergent additives or for fabric desizing or starch liquefaction. They can also be used for the production of sweeteners and ethanol from starch. conzymes (e.g. alpha-amylase, pullulanase, alpha-glucosidase, glucose isomerase, or glucoamylase) that are optimised for expression in plants. The polynucleotides encode mesophilic, thermophilic or hyperthermophilic processing enzymes, which are asophilic, thermophilic or hyperthermophilic processing enzymes, which are solidable conditions to act upon the desired substrate. Also described are self-processing transgenic plants and plant parts, e.g. grain, which express one or more of these plants and plant parte of composition that facilitates plant and grain processing. Also described is a method (M) for converting starch to starch processing enzyme contained in it. Transgenic grain is useful for preparing maltodextrin. A transformed plant (TPP), by activating for preparing maltodextrin, A transformed plant (TP) can be used to produce food products having improved taste and to produce fermentable substrates for ethanol and fermented beverages. (M) eliminates the need to mill or physically disrupt the integrity of plant parts prior to recovery of starch-derived products. The present sequence represents
 Novel polynucleotide encoding hyperthermophilic processing enzymes e.g. alpha-amylase, useful for producing plant to produce food products having improved taste or fermentable substrates for ethanol.

 Mutant alpha-amylase from Bacillus species comprising a methionine substitution - with improved stability and activity at low pH, for use in detergents, dishwashing agents and liquefaction agents.
 The sequence os that of the Asoergillus oryzae alpha amylase, sold commercially as FUNCAMYL (TM) by Novo Nordisk A/S. The sequence can be mutated by substitution of one or more of its methionine residues for any amino acid other than cysteine. The mutant alpha-amylase exhibits a better activity level and better stability in the presence of oxidising agents than previous mutant alpha amylases, and improved thermostability at moderately low pH. The enzyme can be used as an additive for detergents, dishwashing agents and liquifaction agents. (Updated on 25-MAR-2003 to correct PN field.)

This sequence represents the mature form of taka-amylase from A. oryzae. This sequence was used in a method for the generation of mutant pullulanases for use in the food industry (see also ARR79026-28). The wild type pullulanase enzyme was modified by the method of the invention for enhancing the hydrophobicity of a selected site of the pullulanase. The method comprises replacement of a group in the selected site with a hydrophobic group, replacement of an amino acid with a hydrophobic amino acid, and/or insertion or deletion of a hydrophobic amino acid selected site. The method was used to produce neopullulanases Y377F, selected site.

The present invention describes manufacturing maltogenic amylase (EC 3.2.1.133) having improved transglycosylation activity, comprising using crystallisation and the three dimensional structure of maltogenic amylase. Manufacturing maltogenic amylase comprises the following steps: (i) obtaining a gene of maltogenic amylase from Thermus sp. IM6501 (KCTC 50278) and inserting the gene into plasmid put119 to construct recombinant DNA (prhMA118); (ii) inserting the recombinant DNA to Escherichia coli M11061, which is cultivated at 37 plus degrees Celius for 10 hours in Luria-Bertani (LB) media and centrifuging the media to obtain a microbial cell; (iii) suspending the microbial cell with buffer solution at pH 7.5 and obtaining supernatant; and (iv) passing the supernatant through column chromatography and obtaining purified maltogenic amylase. The maltogenic amylase is a dimer comprised of two maltogenic amylase molecules, and a Thermus sp. IM6501 maltogenic amylase (ThMA) crystal The amylase has a structure containing an activated region that consists of amino acid residues of Asp-328 (du-357, Asp-424, and a pocket with glucose bound that consists of amino acid residues of Pro44, Tyr45, Arg81, Arg81, Asm181, Glu1312, Val1329, and Hisl360. The present sequence represents Appergillus oryzae TAKA protein (TAA), given in comparison with ThMA in the present invention
 Manufacturing maltogenic amylase having improved transglycosylation activity, comprises using crystallization.

The invention relates to a method for producing ethanol from starch-containing material, by fermentation. The method involves carrying out a secondary liquefaction step in the presence of a thermostable acid alpha-amylase. The method is used in producing ethanol from a starch-containing material such as tubers, roots or whole grain (e.g. corn, wheat or barley or their combination) or combination of the materials. Preferably ethanol is produced from starch-containing material that is obtained from cereals or from corns, cobs, wheat, barley, rye, milo and potatoes or their combination. The ethanol produced by above mentioned method is used as fuel alcohol and/or fuel additive. The ethanol is also useful as drinking ethanol i.e., potable neutral spirits or industrial ethanol. The present sequence is Aspergillus niger alpha-amylase protein
 Producing ethanol from starch-containing material e.g., tubers, roots, whole grain, for use in fuel, by fermentation comprises carrying out a secondary liquefaction step in the presence of a thermostable acid alpha-

The invention relates to a method for the production of an alcohol product by holding a slurry of water and granular starch in the presence of an acid alpha-amylase and a glucoamylase at 0-20 deg C below the initial gelatinization temperature of the granular starch; holding the slurry in the presence of acid alpha-amylase, glucoamylase and yeast at 10-35 deg C to produce ethanol; and optionally recovering the ethanol. The method is used for the production of an alcohol product such as beer or recovered ethanol, e.g. fuel ethanol, potable ethanol or industrial ethanol. This sequence represents an acid fungal alpha-amylase from Aspergillus niger used in the method of the invention.
 Production of alcohol product, e.g. beer, comprises holding slurry of water and granular starch in presence of acid alpha-amylase and glucoamylase followed by simultaneous saccharification and fermentation.

C;Comment: The alpha amylases are encoded by multigene family.
C;Genetics:
A,Gene: Taa-G1
A,Gene: Taa-G1
A,Introns: $6/1; 69/3; 108/2; 144/3; 221/1; 275/2; 324/2; 404/3
C;Function:
C;Function: catalyzes the hydrolysis of internal 1,4-alpha-D-glucosidic bonds
A;Pescription: catalyzes the hydrolysis of internal 1,4-alpha-D-glucosidic bonds
A;Pesthway: glycogen/starch degradation
C;Superfamily: Aspergillus alpha-amylase; polyasccharide degradation
C;Superfamily: Aspergillus alpha-amylase; hydrolase; polysaccharide degradation

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (see http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
 at high concentrations.

SUBUNIT: Monomer.

SUBUNIT: Monomer.

SUBUNIT: Monomer.

SUBUNIT: Monomer.

SUBUNIT: Monomer.

SUBUNIT: Monomer.

SUDICATION/COST: Used in the brewing industry to increase the fermentability of beer worts (including those made from unmalted cereals), in the starch saccharification, in the alcohol industry to reduce fermentation time, in the cereal food industry for reduce fermentation and improvement of chilled and frozen dough, and in the forsetry industry for low-temperature modification of starch. Sold under the name Fungamyl by Novozymes.

MISCELLANBOUS: The sequence of AMYl and AMY2 is shown.

SIMILARITY: Belongs to the glycosyl hydrolase 13 family.

Biochem. 56:174-179(1992).

-I. CAPALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic linkages in oligosaccharides and polysaccharides.

-I. CORCTOR: Binds 2 calcium ions per subunit. Calcium is inhibitory at high concentrations (By similarity).

-I. SIMILARITY: Belongs to the glycosyl hydrolase 13 family.

"Cloning, characterization, and expression of two alpha-amylase genes
from Aspergillus niger var. awamori.";

Curr. Genet. 17:203-212(1990).

-!-CATALYITC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic

-!-CATALYITC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic

-!-CATALYITC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic

-!-COFACTOR: Binds 2 calcium ions per subunit. Calcium is inhibitory

at high concentrations (By similarity).

-!-SIMILARITY: Belongs to the glycosyl hydrolase 13 family.
